Scenario 1: Employee Salary Analysis

Question:
Find the names and salaries of employees who earn more than the average salary in the company.

Ans:

Step 1: Calculate the Average salary of the employee using AVG()

Step 2: Use WHERE clause to set condition that employee salary more than Average salary.

Step 3: Use SELECT to display the name and salaries of employee based on the condition.

Step 4: Ensure to use correct table and columns.

Scenario 2: Customer Orders without Matching Records

Question:
Retrieve a list of customer names who have not placed any orders.

Ans:

Step 1: Create two tables Customer and Orders.

Step 2: Use LEFT Join to get the connection between customer and order table based on customer_id.

Step 3: Use WHERE clause to set condition Order placed IS NULL.

Step 4: Retrieve the details using SELECT Customer_name and Order placed.

Scenario 3: Product Sales Summary

Question:
Display the total sales amount for each product.

Ans:

Step 1: Use SUM() operation to total the sales amount and display AS Total_Sales_amount.

Step 2: SELECT the sales table and column correctly.

Scenario 4: Department-Wise Employee Count

Question:
List each department name with the number of employees working in it.

Ans:

Step 1: Create two tables employee and department.

Step 2: Use LEFT JOIN to connect the employee and department based on department_id.

Step 3: Use COUNT() to the number of employees working.

Step 4: Use GROUP BY department name to aggregate the data.

Step 5: Use SELECT to display the department name and count of employee.

Scenario 5: Top 3 Highest Sales

Question:
Find the top 3 highest sales transactions.

Ans:

Step1: Select the necessary columns such as sales_id, customer_id and amount etc.

Step 2: Use ORDER BY to sort the amount as descending order.

Step 3: Use LIMIT to get top 3 highest sales transaction.

Scenario 6: Calculate Employee Salary Ranks by Department

You have a table employees with the following columns:

- employee_id (Primary Key)
- name
- age
- salary
- department_id

You also have a table departments with the following columns:

- department_id (Primary Key)

HOPE AI

- department_name

Question:
Write a query to display each employee's name, department name, salary, and their salary rank within their respective department.

Ans:

Step 1: Use INNER JOIN to connect employee data with department information using department_id.

Step 2: Use RANK () to rank the employee based on their salary.

Step 3: Use ORDER BY to sort the ranked employee as descending.

Step 4: Use GROUP BY to aggregate based on respective department.
